Doi: https://doi.org/10.5281/zenodo.22908264

Abstract: The ability to construct academically credible texts from multiple sources has become an essential component of university-level English writing, particularly for philology students who are expected to interpret, compare, evaluate, and integrate literary, linguistic, and scholarly materials. However, source-based writing should not be reduced to the mechanical inclusion of quotations, summaries, or paraphrases. Effective academic synthesis requires learners to identify relevant information across sources, establish relationships among ideas, transform source material into an independently structured text, and develop an academically responsible authorial position. Previous research on integrated and source-based writing has demonstrated that source use, reading-writing interaction, source integration, and argumentation are closely connected to the quality of academic writing, while genuine synthesis remains challenging for many second-language writers. Against this background, the present methodological article develops a structured framework for enhancing English academic writing through multi-source synthesis among undergraduate philology students. The proposed framework integrates critical source comprehension, source evaluation, comparative mapping, controlled paraphrasing, cross-source synthesis, academic argumentation, citation, and recursive revision into a progressive sequence of synthesis-oriented tasks. The methodology consists of five interconnected stages: source awareness and critical reading; source mapping and comparison; controlled source transformation; guided multi-source synthesis; and independent research-based academic writing. An assessment framework is also proposed to evaluate source comprehension, source integration, synthesis and argumentation, organization and coherence, and academic language and citation practices. The framework is theoretically grounded in research on integrated writing and source use but is presented as a methodological proposal rather than as an experimentally validated intervention. Its principal contribution is the systematic integration of reading-to-write processes and source-based synthesis tasks into a coherent instructional sequence specifically adapted to the academic needs of philology undergraduates.

Keywords: academic writing, multi-source synthesis, integrated writing, source use, philology students, EFL, source integration, academic argumentation, reading-to-write, writing pedagogy.

Introduction

Academic writing in English at the undergraduate level increasingly requires students to work with information obtained from several scholarly and disciplinary sources rather than to produce texts exclusively from personal knowledge. For philology students, this requirement is particularly significant because their academic activities frequently involve the interpretation of literary works, comparison of linguistic phenomena, analysis of theoretical positions, and discussion of previous scholarship. Consequently, academic writing competence in philology cannot be understood solely as grammatical accuracy or the ability to produce well-formed paragraphs. It also involves the ability to read critically, identify relevant evidence, distinguish between source positions, transform source information into original formulations, establish relationships among ideas, and construct a coherent academic argument.

Research on integrated writing has demonstrated that writing from sources represents a complex construct involving more than the combination of reading and writing as separate skills. Knoch and Sitajalabhorn [1] argue that integrated writing tasks require a sufficiently precise conceptualization because different task designs can activate different combinations of reading, listening, writing, and source-use processes. Similarly, Plakans [2] demonstrated that reading-to-write tasks can elicit discourse-synthesis processes in university-level second-language writers, although the extent to which individual writers engage in such processes may vary. These findings suggest that academic synthesis should be treated as a distinct competence that needs systematic instructional development rather than being assumed to emerge automatically from general writing practice.

The importance of source use becomes even more apparent in studies examining the relationship between source integration and writing quality. Plakans and Gebril [3], using 480 TOEFL iBT integrated-writing performances, found that several dimensions of source use were associated with writing scores and that source-use features collectively explained more than half of the variance in scores. Particularly relevant was the selection of important source ideas, whereas excessive dependence on the reading source and verbatim borrowing showed less desirable associations with performance. This evidence indicates that academic source use is not simply a matter of including more source material; rather, the quality of selection, transformation, and integration matters.

A related body of research has conceptualized source-based writing as an interactive reading-writing process. Plakans and Gebril [4] found, through a mixed-method investigation of undergraduate students, that writers interacted with source material while composing rather than following a rigid sequence in which reading ended before writing began. Ye and Liu [5] likewise identified an interactive composing process involving source reading, comprehension monitoring, planning, language monitoring, and evaluation. Their findings provide further support for treating reading and writing as interconnected components of integrated academic composition.

The synthesis dimension is particularly important. Vandermeulen et al. [6] investigated source use during argumentative and informative synthesis writing among 294 students and demonstrated that the temporal distribution and combination of source-related activities were associated with text quality. Their findings support the view that synthesis is not adequately described as a linear “read-then-write” activity. Instead, effective synthesis involves movement between sources and the emerging text, with the relative importance of particular source-related activities changing during the writing process. Their models accounted for 24.6% of the variance in argumentative synthesis quality and 16.2% in informative synthesis quality.

Nevertheless, the ability to integrate several sources into a genuinely synthesized academic text remains difficult for second-language writers. Doolan [7], examining post-secondary L1 and L2 source-based writing, found that both groups produced relatively few instances of genuine synthesis, while L1 writing displayed more transformation of source ideas than L2 writing. This finding is pedagogically significant because it suggests that students may learn to cite, summarize, or paraphrase individual sources without necessarily learning how to establish meaningful conceptual relationships among several sources.

The broader research synthesis of Cumming, Lai, and Cho [8] similarly identifies source integration as a major challenge in academic writing and emphasizes the influence of task conditions, prior knowledge, student strategies, and instructional support. Their review also indicates that instruction can contribute to improvements in students’ use of sources. Liu et al. [9], in a thematic review of 53 empirical studies, further emphasize the importance of transparent source-use expectations, source-use knowledge, sustained practice, and explicit pedagogical support for L2 writers.

Recent work also demonstrates that source use cannot be separated from argumentation. Chuang and Yan [10], analyzing 300 L2 integrated argumentative writing performances, found a complex

relationship among source-use characteristics, argumentation effectiveness, and writing performance. Their analysis considered integration style, interpretation accuracy, integration purpose, argument structure, and reasoning quality, suggesting that effective source use contributes to academic writing through its interaction with the development of ideas and arguments rather than functioning as an isolated technical skill.

These findings reveal a methodological gap. The literature provides substantial evidence concerning source use, integrated writing, reading-to-write processes, synthesis, and argumentation, but these insights are not always translated into a coherent sequence of classroom tasks specifically designed for undergraduate philology students learning academic writing in English. Therefore, the purpose of this article is to develop a methodological framework that transforms established findings from source-based writing research into a progressive instructional model for developing multi-source synthesis competence.

The central proposition of the framework is that academic synthesis should be developed progressively: students first learn to understand and evaluate sources, then compare and map information, subsequently transform source material through controlled paraphrasing, and finally integrate multiple sources into independent academic arguments. The framework therefore connects source comprehension with source transformation and ultimately with independent academic voice.

Methodology

The present study adopts a literature-informed methodological design. It does not report a newly conducted classroom experiment and therefore does not claim statistically demonstrated intervention effects. Instead, it synthesizes findings from research on integrated writing, source-based writing, discourse synthesis, reading-to-write processes, source integration, and academic argumentation in order to construct an instructional framework suitable for undergraduate philology students.

The methodological design follows a synthesis-oriented logic in which academic writing is conceptualized as a recursive process involving source comprehension, evaluation, selection, comparison, transformation, integration, argumentation, and revision. This conceptualization is consistent with research showing that writers interact dynamically with sources during composition and that effective source use depends on the relationship between source-related activities and the developing text [2–6].

The proposed methodology is organized into five progressive instructional stages.

Stage 1: Source Awareness and Critical Reading

The first stage establishes the foundation for responsible source use. Students are introduced to the distinction between primary and secondary sources, scholarly and non-scholarly materials, evidence and interpretation, direct quotation and paraphrase, and summary and synthesis. At this stage, the pedagogical objective is not yet to produce a complex synthesis text. Instead, learners develop the ability to understand what a source claims, why the author makes the claim, what evidence supports it, and which information is relevant to the writing task.

A practical task at this stage is the **Source Identification Task**. Students receive two short academic texts addressing the same philological question. They identify the central claim, supporting evidence, key terminology, authorial position, and information that could be relevant to a future academic paragraph. They then answer the question: “What does this source contribute to the topic that another source may not contribute?”

This task shifts reading from passive comprehension toward purposeful academic reading. Such an approach corresponds to research showing that reading-to-write activities involve comprehension monitoring, planning, and interaction between reading and writing processes [5].

Stage 2: Source Mapping and Cross-Source Comparison

Once students can identify the essential information in individual sources, instruction moves toward relationships among sources. The central pedagogical principle at this stage is that synthesis begins before students write the final paragraph. Students must first determine whether sources agree, disagree, complement one another, provide different examples, explain different causes, or approach the same phenomenon from different theoretical perspectives.

A **Source Comparison Matrix** can be used:

Analytical dimension	Source A	Source B	Source C
Main claim			
Supporting evidence			
Key concept			
Agreement with other sources			
Difference/contradiction			
Unique contribution			
Potential use in own argument			

The matrix converts multiple disconnected texts into a structured knowledge representation. It also reduces the likelihood that students will simply reproduce one source at a time in separate paragraphs. Instead, students are encouraged to think relationally.

This stage is strongly supported by synthesis-process research. Vandermeulen et al. [6] found that successful synthesis involves source-related activities distributed across the writing process and that switching among sources can play an important role in the development of synthesis texts. Their findings support instructional activities that require students to compare sources rather than treat each source independently.

Stage 3: Controlled Source Transformation

The third stage focuses on the transformation of source information into academically appropriate language. Students practice moving from direct textual dependence toward independent expression while preserving the meaning and attribution of the original source.

The sequence of tasks progresses from controlled paraphrase to comparative paraphrase and then to integrated paraphrase. In the first activity, students paraphrase one source while maintaining the original meaning. In the second, they paraphrase two related claims and explicitly identify the relationship between them. In the third, they combine the claims into one paragraph using appropriate reporting verbs, attribution, comparison markers, and analytical language.

For example, instead of producing:

Smith states X. Jones states Y.

students are trained to construct a relationship such as:

While Smith emphasizes X, Jones approaches the issue from the perspective of Y, suggesting that the phenomenon can be understood through both dimensions.

The pedagogical objective is not stylistic ornamentation but conceptual transformation. Students must demonstrate that they understand the relationship between the sources and can represent that relationship using their own textual structure.

This stage is particularly important because research indicates that lower-performing integrated writing may involve greater dependence on source wording, while more successful performances involve selecting important ideas and using source material more purposefully [3]. The source-use pedagogy literature likewise emphasizes explicit knowledge and continuous practice rather than assuming that students will automatically acquire appropriate source-use conventions [9].

Stage 4: Guided Multi-Source Synthesis

The fourth stage represents the central component of the proposed framework. Students work with three to five sources addressing a shared philological question and produce a synthesis paragraph or short synthesis essay.

The teacher provides a conceptual scaffold consisting of four questions:

1. What do the sources have in common?
2. Where do the sources differ?
3. What additional insight does each source provide?
4. What conclusion can the writer construct by bringing the sources together?

Students first produce a synthesis map, then develop a central claim, select relevant evidence, organize the evidence according to conceptual relationships, and construct the paragraph.

A successful synthesis paragraph should therefore not have the structure:

Source A → Source B → Source C.

Instead, its structure should be:

Academic claim → Source A + Source B relationship → Source C qualification/extension → Writer's interpretation → Concluding synthesis.

This distinction is central to the methodology. Doolan's [7] findings that genuine synthesis was relatively uncommon in source-based writing demonstrate why students need explicit practice in transforming several source ideas into a unified text.

The teacher's role at this stage is gradually reduced. Initially, students receive a synthesis matrix and sentence frames; subsequently, only the matrix is provided; finally, students construct their own synthesis map. This gradual release of scaffolding is intended to move learners from supported source integration toward independent academic composition.

Stage 5: Independent Research-Based Academic Writing

The final stage requires students to transfer the previously developed processes to an independently formulated academic task. Students select a philological topic, identify appropriate scholarly sources, evaluate their relevance, construct a source map, formulate a research-oriented claim, and produce an academic text.

At this stage, the final product should demonstrate five interconnected abilities: responsible source selection, accurate source interpretation, meaningful cross-source synthesis, independent argumentation, and academic textual control.

The final writing task may take the form of a short research essay, literature-based analytical paper, comparative linguistic analysis, or theoretical discussion. For philology students, suitable topics could involve phraseological units, literary translation, linguistic-cultural phenomena, discourse analysis, stylistic features, or comparative literary interpretation.

The task should require students to use multiple sources rather than relying on one dominant source. This requirement is important because integrated writing is a distinct construct whose performance depends partly on task characteristics and source-integration demands. A meta-analysis by Chan and Yamashita [11] found that reading and writing skills were more strongly associated with integrated-writing performance than listening, while source integration and organization were among the relevant text-quality correlates.

Results and Discussion

The principal outcome of the methodological synthesis is the development of a five-stage instructional framework connecting multi-source reading with independent academic writing. The framework can be represented as a progressive movement:

Source awareness → Source mapping → Source transformation → Multi-source synthesis → Independent academic writing.

The first important implication is that synthesis should not be introduced as a single advanced writing assignment. Research on integrated writing demonstrates that source-based composition activates multiple cognitive and textual processes, including comprehension, selection, planning, source interaction, transformation, and revision [2,4–6]. Therefore, a pedagogically coherent curriculum should distribute these processes across a sequence of increasingly demanding tasks.

The second implication concerns the distinction between **source use** and **source synthesis**. A student may cite five sources without synthesizing them. Similarly, a paragraph containing several quotations does not necessarily demonstrate academic synthesis. Synthesis occurs when the writer establishes a meaningful conceptual relationship among source ideas and reorganizes those ideas within an independently constructed textual structure. This distinction is supported by Doolan [7], who found relatively few instances of genuine synthesis in both L1 and L2 source-based writing.

The third implication concerns the relationship between synthesis and academic voice. Academic voice should not be interpreted as eliminating sources from the text. On the contrary, the writer's voice becomes visible through the selection, interpretation, comparison, organization, and evaluation of source material. Thus, the proposed methodology treats citation not as the final step after writing but as an integrated component of academic reasoning.

The fourth implication concerns the temporal organization of writing. The findings of Vandermeulen et al. [6] are particularly relevant because their process analysis demonstrates that source-related activities are not uniformly distributed throughout composition. Students initially devote substantial attention to sources, subsequently move between sources and their developing text, and eventually shift toward text production and revision. Consequently, teaching should not impose an overly rigid sequence in which all reading occurs first and writing begins only afterward. Instead, students should learn to return to sources strategically when clarification, verification, or evidence is needed.

The fifth implication concerns argumentation. Source integration becomes academically meaningful when it contributes to a claim or interpretation. Chuang and Yan [10] demonstrate that the relationship between source use and writing performance is complex and mediated by argumentation-related features. Therefore, synthesis instruction should progress beyond "using sources correctly" toward using sources to support, qualify, contrast, extend, or challenge an academic claim.

On the basis of these principles, the following assessment framework is proposed:

Criterion	**Weight**	**Main indicators**
Source comprehension and evaluation	20%	Accurate understanding, relevance, credibility, appropriate selection
Source integration	25%	Attribution, paraphrase, citation, meaningful incorporation
Synthesis and argumentation	25%	Cross-source relationships, interpretation, reasoning, independent claim
Organization and coherence	15%	Logical progression, paragraph unity, cohesion
Academic language and citation	15%	Formal register, grammatical control, terminology, citation accuracy
Total	**100%**	

This rubric is proposed as a methodological instrument rather than a statistically validated measurement scale. Its purpose is to make the targeted construct visible to both teachers and students. The weighting deliberately gives substantial emphasis to source integration and synthesis because the central objective of the framework is not merely grammatical writing but academically responsible construction of knowledge from multiple sources.

The framework also has implications for teacher feedback. Conventional writing feedback frequently concentrates on the final product: grammar, vocabulary, organization, and surface errors. However, the research of Vandermeulen et al. [6] suggests that the writing process itself provides important information for understanding synthesis quality. Therefore, teachers can provide process-oriented feedback by asking students to submit a source matrix, synthesis map, preliminary claim, and first paragraph together with the final essay. This allows the teacher to identify whether difficulties originate from source comprehension, selection, comparison, transformation, or textual organization.

The proposed framework is particularly relevant to philology because philological writing frequently requires students to move between texts, interpretations, theoretical concepts, and competing scholarly positions. Literary analysis, translation studies, linguistics, stylistics, discourse studies, and comparative literature all require the writer to construct an interpretation from existing textual and scholarly evidence. Multi-source synthesis therefore represents not an additional skill outside philology but a mechanism through which philological knowledge can be academically constructed and communicated in English.

At the same time, the methodology has limitations. First, the framework has been derived from existing literature and has not yet been tested experimentally with a defined group of undergraduate philology students. Second, the empirical studies on which the framework is based differ in participants, tasks, languages, assessment systems, and educational contexts. For example, Vandermeulen et al. [6] investigated Dutch secondary students, whereas Plakans and Gebril [3,4] examined undergraduate and test-based L2 writing contexts. Consequently, direct generalization to Uzbek philology undergraduates should be avoided until empirical validation is conducted.

Future research should therefore implement a quasi-experimental design involving an intervention group receiving systematic synthesis-oriented instruction and a comparison group receiving conventional academic-writing instruction. Pre-test and post-test writing samples could be evaluated using the proposed analytic rubric. Additional process data, such as students' source matrices, drafts, revisions, and think-aloud protocols, could help determine which components of the framework contribute most strongly to improvement. Such research would transform the present methodological framework from a theoretically grounded proposal into an empirically validated instructional model.

Conclusion

Developing English academic writing among undergraduate philology students requires more than teaching grammatical accuracy, paragraph organization, or conventional essay structure. When students write from multiple sources, they must learn to comprehend, evaluate, select, compare, transform, integrate, and interpret information while simultaneously constructing an independent academic argument. Research on integrated writing consistently demonstrates that these processes are interconnected and that source use is a substantive component of academic writing rather than a supplementary citation technique.

The methodological framework proposed in this article responds to this requirement by organizing synthesis instruction into five progressive stages: source awareness and critical reading, source mapping and comparison, controlled source transformation, guided multi-source synthesis, and independent research-based academic writing. The framework is designed to move students gradually from dependence on individual sources toward the ability to construct an academically coherent text in which multiple sources are transformed into a unified argument.

The central pedagogical principle is that genuine synthesis should be explicitly taught. Students should not be expected to acquire synthesis competence simply through repeated essay writing. Instead, they need structured opportunities to identify relationships among sources, practice transformation, develop synthesis maps, construct claims, integrate evidence, and revise their texts recursively. This

position is consistent with empirical research showing that source integration, reading-writing interaction, source-related processes, and argumentation are important dimensions of integrated academic writing.

For philology undergraduates, the proposed methodology has particular relevance because their disciplinary practices inherently involve interpretation and comparison of texts and scholarly perspectives. Multi-source synthesis can therefore serve as a bridge between philological thinking and academic English writing, enabling students to transform reading and analysis into independent scholarly discourse.

The framework should ultimately be subjected to empirical validation with undergraduate philology students in an EFL context. Such research should examine changes in source integration, synthesis quality, argumentation, organization, academic language, and citation accuracy before and after systematic instruction. Until such evidence is obtained, the present model should be understood as a literature-informed methodological framework rather than as a proven intervention effect. Its value lies in translating established findings from integrated-writing research into a coherent, progressive, and discipline-sensitive approach to academic synthesis writing.
